

1. Document-level Military News Input

The M-country Navy amphibious assault ship Saipan, together with Helicopter Mine Countermeasures Squadron 15, HM-15 Blackhawks, successfully completed a training exercise in the Persian Gulf on November 7. Personnel from HM-15 “Blackhawks” operated an HM-53E Sea Dragon helicopter towing the MK-105 magnetic influence minesweeping system, also known as the "sled ".

The sled is a high-speed minesweeping system. It is well suited for clearing magnetic-influence and acoustic-influence mines, enabling more flexible and faster mission execution. Years of experience have shown that mine countermeasure operations are highly useful to the Navy because they protect ships and personnel from invisible threats in the water.

HM-15, together with the sled, was loaded aboard Saipan on November 3. This exercise marked the second successful demonstration of minesweeping capability in the Persian Gulf within two months. Saipan is currently deployed in the M-country Navy Fifth Fleet area of operations, conducting maritime security operations in the Gulf of Aden, the Gulf of Oman, the Persian Gulf, the Arabian Sea, the Red Sea, and the Indian Ocean.

Maritime security operations help ensure the safety and stability of the maritime environment, while also contributing to counterterrorism and regional security. These military operations counter the use of the sea by international terrorists to conduct attacks and to transport personnel, weapons, or other materials.

2. Target-related Event Detection

Target-related events detected
Event detection results:

3.Temporal Event Chain Reconstruction

Reconstruct the event chain based on temporal order

1 Exhibit → 2 Deploy → 3 Support

Vector recall: No relevant event

Reordered event chain: Deploy → Exhibit → Support

Vector supplementation:

Add the extracted event. After argument extraction is completed, further supplement relevant information into the vector database.

4. Detailed Target Trajectory Extraction & Argument Resolution
